

ReadMe

In this assignment, we have to do continue the last assignment, which means keep the three domain classes: Course, User and Enrollment and do a real application with it.

I create one controller for each domain classes. Then, I had to create views: one folder for each domain class, one folder for the layout and directly in the view folder the welcome view with the form template.

To start using the application, you can log in with user mchancer: login: 'mchancer', password: 'mchancer' or you can register.

When you try to log in, you have alert telling you if your username and your password are correct.

When you register, you will have alerts when you are choosing a username already existed and when you are missing the username and/or password field. If your credentials are correct, you are redirected to the home page with an alert telling you that your credentials have been saved.

When you are not logged in, you can see the courses and search in courses but you cannot register. You can search for courses from wherever you want in the website. It will always show you the first five results. If you click on Enrollment, you will be redirected to the home page with a message saying that you have to register to see your enrollments.

When you are logged in, you can see the courses and a link to register to them. When you click on Register, you have an alert confirming that you are well registered or preventing you that you already are registered to this course. When you click on enrollment, you can see your enrollments and delete them.

Finally, you can log out with the link in the navigation bar or on the Home Page.
